A graph is a set of vertices connected by edges.
Breadth-first search explores a graph level by level using a queue.
Depth-first search follows a path as deep as possible using a stack or recursion.
Dijkstra's algorithm finds shortest paths in graphs with non-negative edge weights.
A tree is a connected graph with no cycles.

Topological sort orders the vertices of a directed acyclic graph.
Union-find tracks connected components and supports near constant time merges.
Minimum spanning trees can be built with Kruskal's or Prim's algorithm.
